Food Ordering Service

Build a chatbot that can get food orders for a pizza restaurant

Let's Create Our Data Set

Order food:

I like to order pizza

I like to place an order

Do you deliver

Do sell pizza?

Let's Create Our Data Set

Cancel/modify order:

I want to cancel

I need to change my order

I don't want my order

I changed my mind

Python

<https://www.pythonanywhere.com/try-ipython/>

```
order = ["I want order", "i want"]
```

```
cancel=["cancel", "no"]
```

```
dic = {}
```

```
for s in order + cancel:
```

```
    for w in s.split():
```

```
        dic[w] = len(dic)
```

Preparing the data

```
import numpy as np
```

```
X = np.zeros([len(order)+len(cancel), len(dic)])
```

```
i = 0
```

```
for s in order + cancel:
```

```
    for w in s.split():
```

```
        if w in dic:
```

```
            X[i,dic[w]] = 1
```

```
        i = i + 1
```

```
target = [1]*len(order) + [0]*len(cancel)
```

Fitting the model

```
from sklearn.linear_model import LinearRegression
```

```
model = LinearRegression(fit_intercept=True)
```

```
model.fit(X,target)
```

Preparing test data

```
X_test = np.zeros([len(test), len(dic)])
```

```
i = 0
```

```
for s in test:
```

```
    for w in s.split():
```

```
        if w in dic:
```

```
            X_test[i,dic[w]] = 1
```

```
        i = i + 1
```

Prediction

```
yfit = model.predict(X_test)
```
